

## **ACKNOWLEDGEMENTS**

This book is based on a Ph.D. dissertation defended at the Vrije Universiteit Brussel (Brussels, Belgium; 1989). In the first place, therefore, I would like to thank my promoter Prof. F. De Pauw, who aroused and stimulated my interest for the law of the sea, and co-promotor Prof. F. Gorlé, whose profound knowledge of the Russian language and Soviet legal system proved indispensable for the successful completion of this endeavor, as well as the other members of the reading committee for their comments and advice. The idea of conducting a comparative study on Arctic related matters germinated while I was completing my LL.M. degree requirements at the University of Georgia (Georgia, United States; 1983). Under the direct guidance of Prof. L. Sohn, the basic skills of comparative writing in the law of the sea were acquired. I am deeply grateful to all of them for their encouragement and support.

I also gladly acknowledge my gratitude to the British Council, the R. & D. sector of the Vrije Universiteit Brussel and the former Belgian Ministry of Education, without whose financial support, the one-month visits to the Scott Polar Research Institute (University of Cambridge, United Kingdom; 1986), Moscow State University (U.S.S.R.; 1988) and different Institutions and Government Agencies in Canada and the United States (1988) would not have been possible. These trips provided the bulk of the information on which this study is based. Later, shorter visits to the same institutions and agencies updated these materials. At the same time these stays abroad provided an opportunity to meet many knowledgeable people on the subject, as well as the internationally recognized specialists: Prof. W. Butler for the Soviet angle and Prof. D. Pharand for the Canadian viewpoint. Especially the latter deserves my deepest gratitude: Not only for his generous hospitality and most helpful attitude (his private library disclosed many of its secrets to me), but also because he spared neither effort nor time to read through a preliminary draft of the Canadian aspect of my research. I remain much obliged to Prof. D. Pharand. In this respect also R. Arnaudo (Head, Division of Polar Affairs of the U.S. Department of State) and R. Hage (Director, Legal Operations Division of the Canadian Department of External Affairs) have to be thanked for reading through parts of the manuscript and making useful suggestions.

During this rather long period of research I was always able to rely on some secure sources of information. I therefore gladly acknowledge my gratitude to T. Armstrong and B. Headland of the Scott Polar Research Institute (United Kingdom); R. Arnaudo, once again, of the Department of State, Bureau of Oceans and International Environmental and Scientific Affairs, Office of Ocean and Polar Affairs and P. Johnson of the Arctic Research Commission

(United States); L. Innadze and A. Kolodkin of the former Soviet Association of Maritime Law (Russia); G. Kloosterman of the Communications Directorate, Fisheries and Oceans and G. Bretton of the Circumpolar Affairs of the Ministry of Indian and Northern Affairs (Canada) and O. Rogne of the International Arctic Science Committee (Norway).

The maps found throughout the book were only possible thanks to the kind cooperation of Prof. R. Paepe of the Vrije Universiteit Brussel, Head Geologist-Director of the Belgian Geological Survey, who allowed me to make use of his sophisticated computer facilities to produce these high quality illustrations.

And finally, I would like to mention my family. Although this may seem a rather common practice, one has to live through the experience in order to fully grasp its importance. Simply too many vacation weeks were spent apart. I hope I will still be able to make up for it.
